VALENTIN ENCHEV

QA Engineer

Nicosia, Cyprus | +357 99155670 | valentinenchev16@gmail.com | ValkaYuh.github.io

SUMMARY

QA Engineer with 2+ years testing a fintech remittance product across iOS, Android and web. One of two QAs on the backend automation project, where I wrote 100+ tests in Java and TestNG, and owner of manual QA for the Android app through a full rewrite of the front end test suite. Comfortable across the whole defect lifecycle: reproducing an issue, capturing the network evidence, filing it clearly, and verifying the fix.

EXPERIENCE

TalkRemit Sofia, Bulgaria

Software QA Engineer 06/2023 - 01/2025

QA team of 5 supporting a 16 person engineering team, on a two week release cycle. Embedded with the developers through daily standups and a standing QA, product and engineering sync for open issues and urgent work.

- Wrote 100+ backend automation tests in Java and TestNG as one of only two QAs on the automation project.
- Owned manual QA for the Android app and covered web alongside it, running regression, smoke, exploratory and end to end testing for every release.
- Rewrote the entire front end manual test suite in TestCaseLab after a major mobile redesign, updating existing cases and adding coverage for new flows.
- Unblocked test cases that had previously been impossible to automate: new card authentication triggered a chain of requests that could not be reproduced by hand through the API, so I drove the Java tests to the authentication step, then handed the triggering request to a headless browser to complete the chain on its own.
- Used Postman to verify new API endpoints before automating them and to prototype end to end flows before writing the Java implementation; ran SQL queries in DBeaver to confirm data state during testing.
- Led testing for the migration from an in house KYC system to a third party provider: worked out how the new integration behaved, then wrote the test cases covering it.
- Filed and managed bugs in Jira, attaching DevTools network traces and HAR captures so developers could reproduce issues immediately, and helped trace hard to reproduce production bugs to root cause.
- Built a load testing suite with Apache JMeter and maintained the team's QA process documentation in Confluence.

Software QA Engineer, Intern 11/2022 - 05/2023

- Picked up Java from scratch and was contributing to the backend automation project before the internship ended.
- Ran regression, smoke and exploratory testing on release candidates, wrote and updated manual test cases, and learned the team's Jira workflow and release process.

PROJECTS

Valorant Esports Prediction Model Python 02/2025 - 07/2026

- Built a scraper in Python to collect and clean match data across five tiers of professional play, validating the dataset for consistency before use.
- Trained and evaluated a match outcome model reaching ~75% accuracy on held out data, then ran feature importance analysis and reworked the feature set to improve it.
- Backtested predictions against historical market odds as an independent check on real world performance.

FlightInc Godot 2025

- Built and shipped a game solo in one week for the Brackeys 2025 jam. Ranked #142 in Innovation and #664 overall out of 2,199 entries.

SKILLS

QA: Manual QA, test case design and maintenance, regression, smoke, exploratory and end to end testing, API testing, load testing, mobile (Android, iOS) and web

Automation: Java, TestNG, Selenium, Postman, Apache JMeter, Git

Tools: Jira, Confluence, TestCaseLab, DBeaver, SQL, Chrome DevTools and HAR analysis

Programming: Java, Python, C++

Also familiar with: PyTorch, CatBoost, AutoGluon, BeautifulSoup, Godot

LANGUAGES, CERTIFICATION AND INTERESTS

Languages: English (Native), Greek (Proficient), Bulgarian (Proficient) | IELTS Academic, CEFR Level C1, British Council, 2022

Interests: Esports and gaming, machine learning, hardware and troubleshooting, astrophotography
